

ABSTRACT

The invention relates to a sealing foil with a substrate (2), a primer layer (3) and at least one extruded functional layer (6). Such a sealing foil is improved with a view to suppressing migration in that between the primer layer (3) and the extruded functional layer (6) an extruded barrier layer (4) is provided which prevents at least the migration of components of the primer layer (3) and/or of the functional layer (6).

The sole Figure 5 has been provided for publication with the abstract.
